

Key:

"□" ← A machine

"→" ← Path of a write

A master-+ + broadcaster-+ + listener-+ + replier-+ + store-view-+ + B-tree, all on the same machine and for the same branch, is also sometimes called a "Master".

- Every replica has exactly 1 master.
- Every replica is exactly the same (for a given master)
- cluster_namespace_interface.t finds masters via the metadata
- If replier+ exists, master may send write, read, or writeread. If not, master may only send write.
